

NEWS RELEASE

SID2U expands ASA to add Symantec Norton and F-Secure to their patch management component

SID2U.com, a leading provider of managed service solutions, has significantly expanded its [ASA](#) product offering to include patch management features for Symantec Norton and F-Secure, in addition to the existing coverage of McAfee and AVG.

Michael O'Donoghue (Technical Director) says 'The introduction of the Security Center in Microsoft Windows XP Service Pack 2 provided a method for users to see at a glance if their Anti-virus was out of date. Support for the new features from security vendors was excellent and almost all established security software now employs these features. With ASA we further leverage this information scanning the entire LAN and providing alerts to administrators as required.'

6, Castlerosse Drive
Baldoye
Dublin 13
Ireland

[ASA](#) is a comprehensive and centralized product for the provision of IT managed services. It is designed to ease the burden of managing a network environment, strengthens security defences, ensure regulatory compliance, ease deployment and save on time, wasted effort and reduce cost. The full range of ASA's comprehensive features includes: - software deployment, bandwidth monitoring, environment change management, asset management, patch management, software licence, ping management, backup management and many network utilities in one complete product with no add on integration cost.
